- Types of measurements
- Central tendency: Types of averages
- Five-figure summary

# Types of measurements

- Nominal
- Ordinal
- Interval
- Ratio

# Nominal scale measurement

- Discrete data
- Label variables without quantitative value
  - E.g. hair color, first names
- Mode is the proper measure of central tendency - most common category

# Ordinal scale measurement

- Discrete data
- Order of values are important but the difference between each may not be consistent
  - E.g. levels of satisfaction, happiness
- Median is a valid measure of central tendency

# Interval scale measurement

- Discrete and continuous data
- Order of values are important, differences between units are meaningful and has equal distance
  - E.g. temperatures in celsius and fahrenheit, time of day, test score
- Permits only addition and subtraction
  - E.g. 40F and 80F: Twice as hot doesn't make sense when comparing temperature

# Ratio scale measurement

- Discrete and continuous data
- Order of values are important, differences between units are meaningful, has equal distance, and has an absolute 0/true 0 point
  - E.g weight, height
- Allows for all mathematical operations
  - E.g. 20kg is twice as heavy as 10kg

| <b>Valid</b>  | <b>Nominal</b> | <b>Ordinal</b> | <b>Interval</b> | <b>Ratio</b> |
|---|----------------|----------------|-----------------|--------------|
| Frequency Distributions                                       | Yes            | Yes            | Yes             | Yes          |
| Median, percentile ranges                                     | No             | Yes            | Yes             | Yes          |
| Addition, subtraction, mean,<br>standard deviation            | No             | No             | Yes             | Yes          |
| Multiplication, division, ratios,<br>coefficient of variation | No             | No             | No              | Yes          |

# Central tendency: Types of averages

- Mean
- Median
- Mode

# Central tendency: Types of averages

- Mean:
  - Total of observations divided by total number of observations
- Median:
  - The middle observation
- Mode:
  - The most frequent observation

# Practice: Type of averages

Burial ages in Accrington (UK) in 1838

8, 20, 82, 3, 17, 0, 0, 22, 12, 22, 54, 0, 32, 41

- What kind of measurement is age?
- Mean:
- Median:
- Mode:

## Practice: Types of averages

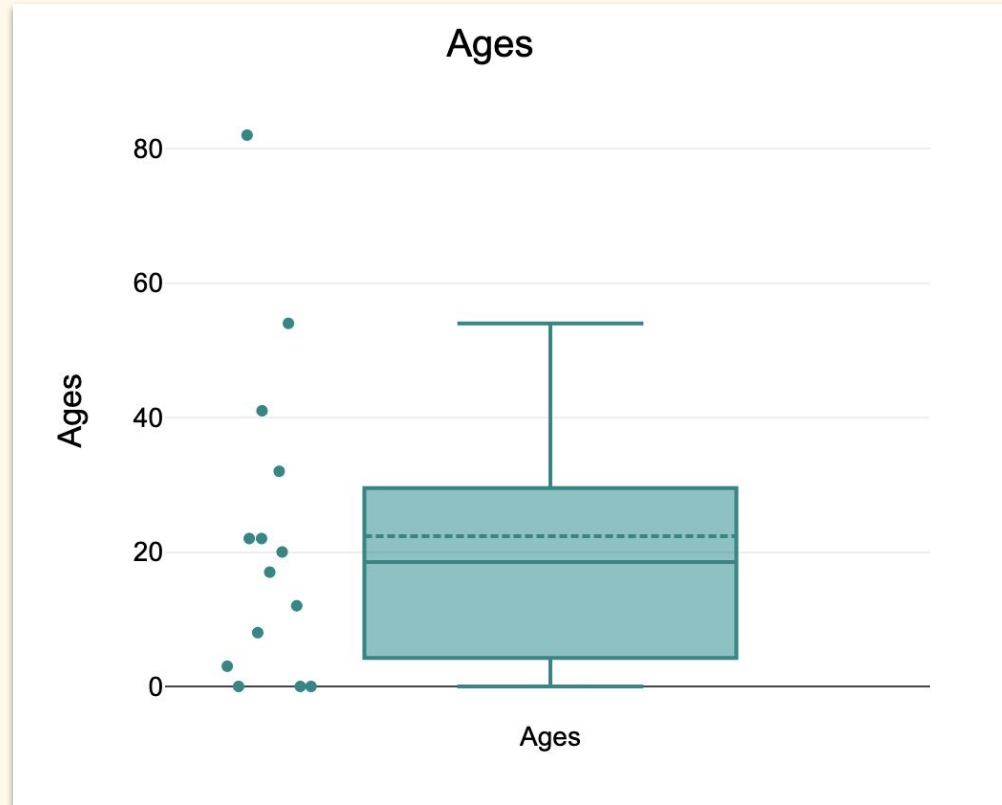

What is the most appropriate measure of central tendency for each situation?

- Ideal temperature for Spring
- Fruit for the class
- Confidence in cooking

# Five-figure summary

- Median
- Upper quartile
  - Marks the value that represents 75% of the data
- Lower quartile
  - Marks the value that represents 25% of the data
- Minimum observation
- Maximum observation

# Presenting the five figure summary

## Practice: Five figure summary

Let's plot our class' ideal temperature for spring
